

# Activity

## Part I

### Databases

# Topics

---

- ▶ **Conceptual Data Modeling using Entity – Relationship Model**
- ▶ **Entity-Relationship Model**
  - ▼ **Entity**
  - ▼ **Attribute**
  - ▼ **Key**
  - ▼ **Relationship**

# Why is Database Design Important?

---

- ▶ Assume that you are given the task of designing a database for a company!
- ▶ How do you decide:
  - ▼ How many tables should be there in your database?
  - ▼ How many columns should be there in each table?
  - ▼ What are these columns?

# Why is Database Design Important (cont...)?

- Why is the following table not considered as a good design?

| <u>StudentID</u> | Name   | <u>ModuleCode</u> | SubjectName                 | Grade | Description |
|------------------|--------|-------------------|-----------------------------|-------|-------------|
| 11111            | Alicia | DB                | Database                    | A     | Excellent   |
| 11111            | Alicia | OOP               | Object-Oriented Programming | B     | Very Good   |
| 22222            | Peter  | CT                | Critical Thinking           | C     | Good        |
| 33333            | John   | DB                | Database                    | B     | Very Good   |
| 33333            | John   | OOP               | Object-Oriented Programming | A     | Excellent   |
| 33333            | John   | NF                | Network Fundamentals        | A     | Excellent   |

# Why is Database Design Important (cont...)?

► A better design could be:

| <u>StudentID</u> | Name   |
|------------------|--------|
| 11111            | Alicia |
| 22222            | Peter  |
| 33333            | John   |

| <u>Grade</u> | Description |
|--------------|-------------|
| A            | Excellent   |
| B            | Very Good   |
| C            | Good        |

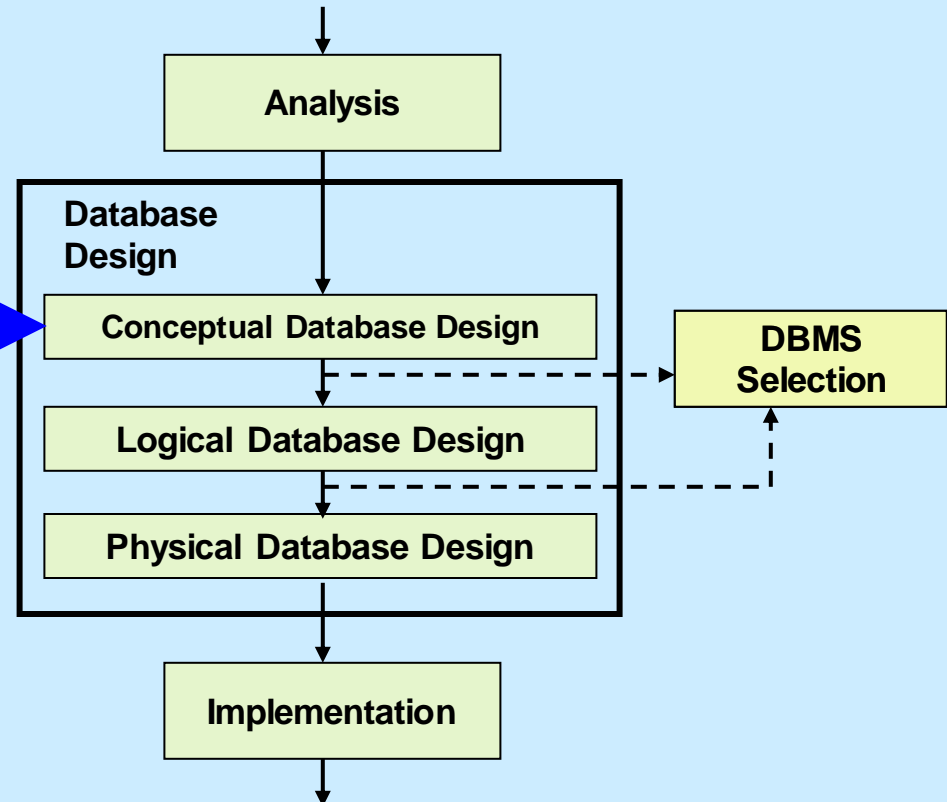

| <u>ModuleCode</u> | SubjectName                 |
|-------------------|-----------------------------|
| DB                | Database                    |
| OOP               | Object-Oriented Programming |
| CT                | Critical Thinking           |
| NF                | Network Fundamentals        |

| <u>StudentID</u> | <u>ModuleCode</u> | Grade |
|------------------|-------------------|-------|
| 11111            | DB                | A     |
| 11111            | OOP               | B     |
| 22222            | CT                | C     |
| 33333            | DB                | B     |
| 33333            | OOP               | A     |
| 33333            | NF                | A     |

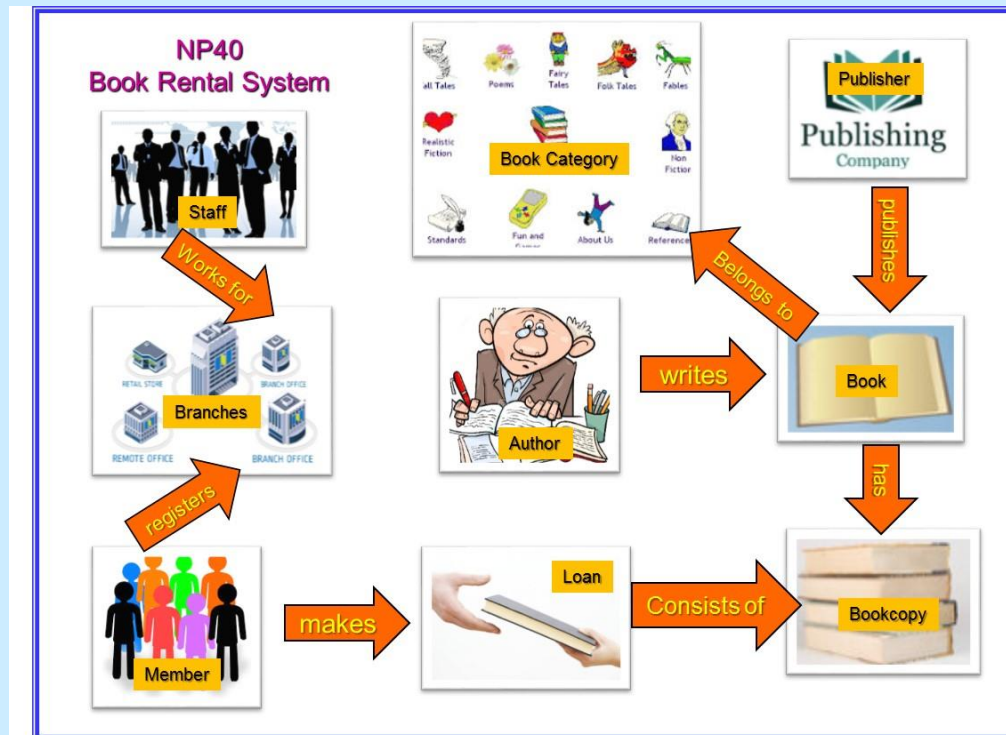

# Database Design Stage in Database Application Lifecycle

## Conceptual Database Design

To construct a model that captures the overall structure of organisational data, while being independent of any DBMS or other implementation consideration.

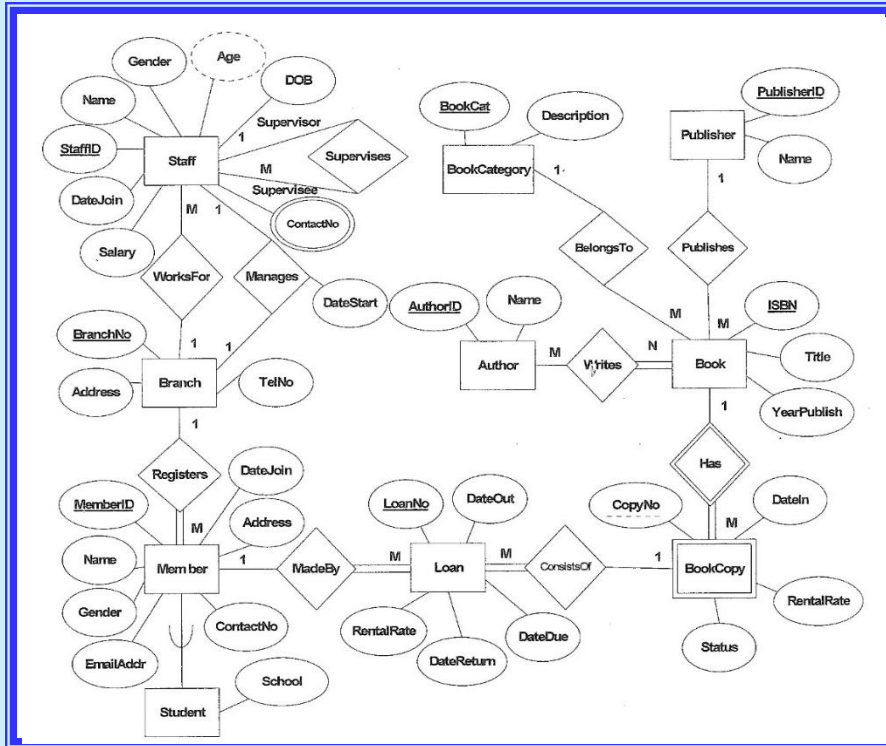

# Conceptual Data Modelling

A tool is required for communications between the database designers and end users during analysis phase of database development.

# Conceptual Data Modelling

► **E-R (Entity-Relationship) Model** is the tool often used to construct a conceptual data model.

- Relative ease of use.
- Widespread CASE tool support.
- Belief that entities and relationships are natural modelling concepts in the real world.

**NP40**  
**Book Rental System**

# E-R MODEL

- ▶ **E-R Model was introduced in a key article by Chen (1976).**
- ▶ **The model was subsequently extended to include additional constructs by Chen & others (1986, 1991).**
- ▶ **Refer to Appendix for the Notations used for the E-R Model.**

# E-R Model

- ▶ Provides a detailed and logical representation of the data of an organisation or a business area.
- ▶ Expressed in terms of Entities of business environment, Relationships (or associations) among these entities, and the Attributes (or properties) of both entities and relationships.

# Entity

# Entity

- ▶ Person, place, object, event or concept in the organisation or business area to be modelled.

# Entity

---

## Notation:

An entity is represented by a rectangular box.

ENTITY

## Examples:

PRODUCT

ORDER

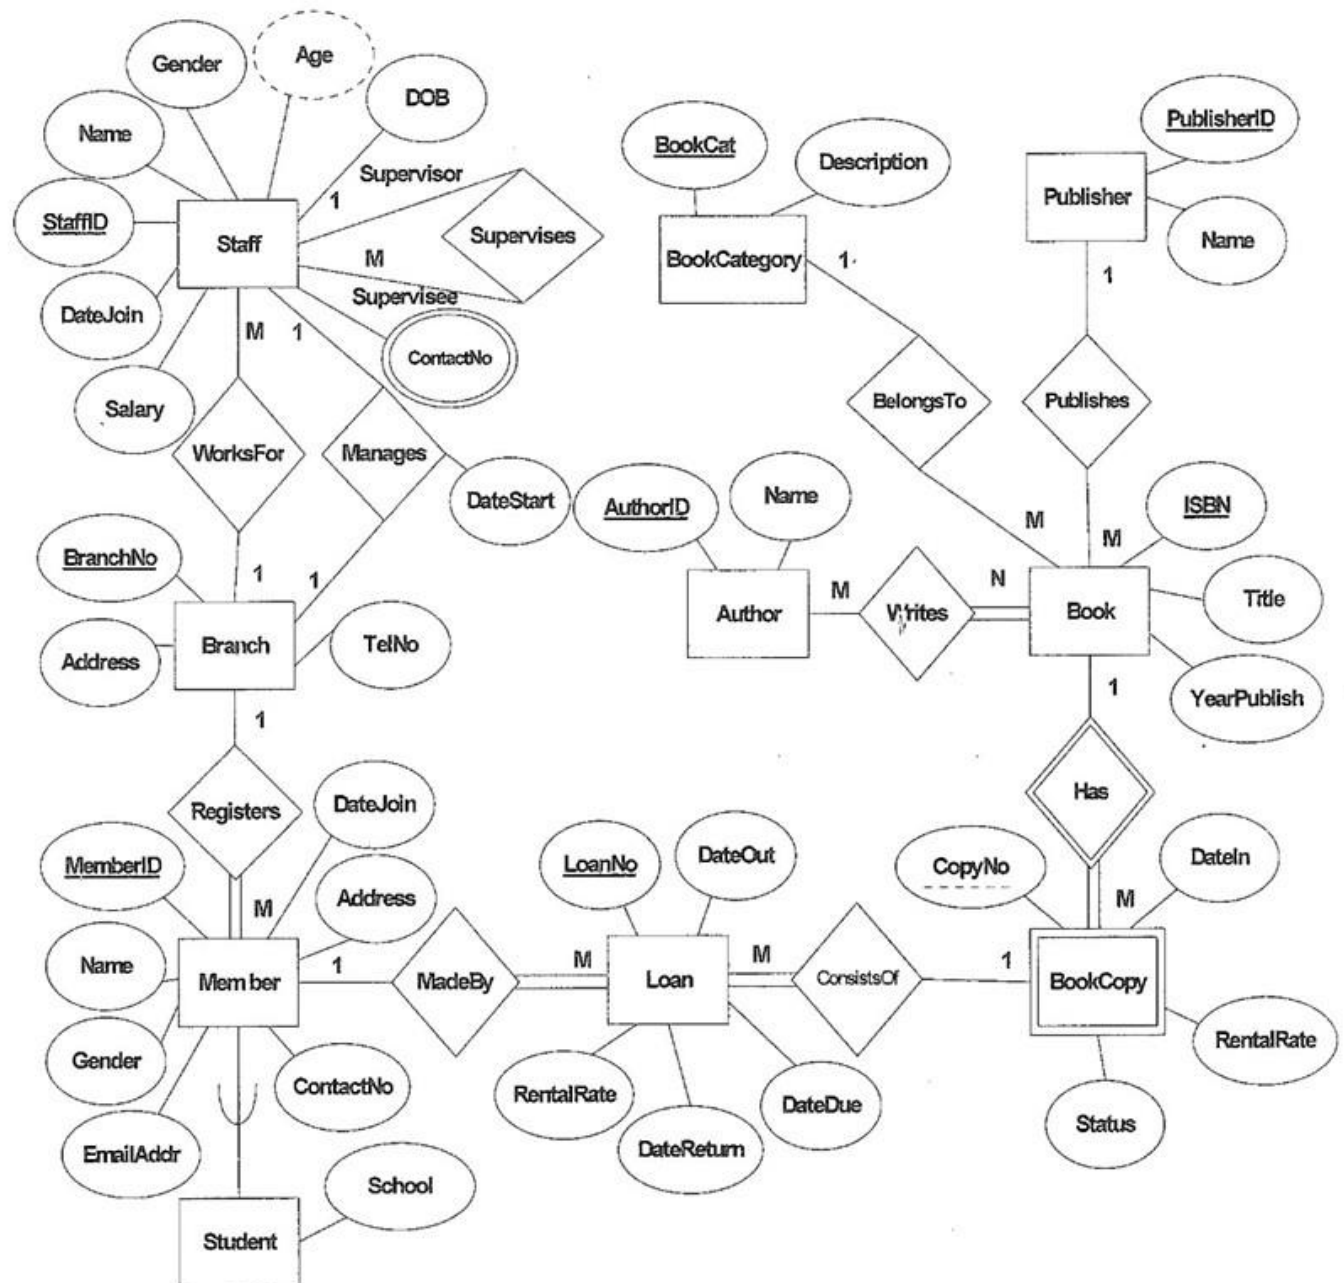

CUSTOMER

SALESPERSON

# Entity

Can you identify all the entities in this model?

# Attribute

# Attribute

---

- ▶ A property or characteristic of an entity that is of interest to the organisation or business area concerned.
  - ▼ Each entity has a set of attributes associated with it.
- ▶ An example:
  - ▼ SALESPERSON entity has attributes:  
employee number, name, date of birth, sex ,...

**NB: Relationships may also have attributes.**

# Attribute

## Notation:

An attribute is represented by an oval.

Attribute

Each MEMBER has an MemberID, Name, Gender, ...

A line connects an attribute to the entity type that it is associated with.

# Classification of Attributes

---

- ▶ An attribute can be classified by the component(s) it has:
  - ▼ SIMPLE attribute
  - ▼ COMPOSITE attribute
- ▶ An attribute can be classified by the value it holds:
  - ▼ SINGLE-VALUED attribute
  - ▼ MULTI-VALUED attribute

# Simple Attribute

A simple attribute composed of a SINGLE component with an independent existence.

- ▶ Simple attributes cannot be further divided and are sometimes called Atomic attributes.
  - ▼ Examples: Gender, Salary, Color

## Notation:

A Simple Attribute is represented by an oval.

A diagram showing a simple attribute represented by an oval. The word "Attribute" is written in green text inside a white oval with a black border.

Attribute

# Composite Attribute

A composite attribute composed of MULTIPLE components, each with an independent existence.

A line connects the component attribute to the composite attribute.

**ADDRESS** is a composite attribute consisting of 4 simple attributes.

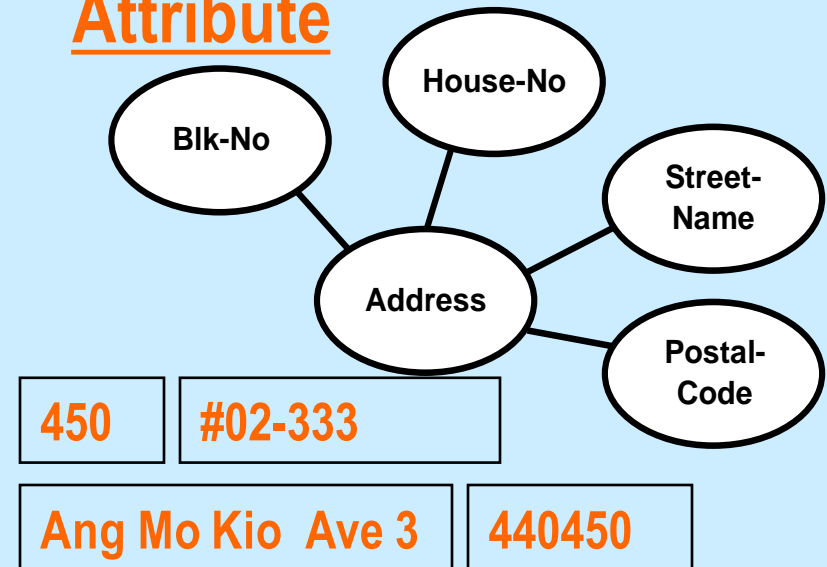

# Simple or Composite Attribute?

## Simple Attribute

Block 450, Ang Mo Kio Ave 3,  
#02-333, Singapore 440450

## Composite Attribute

The decision to model the Address attribute as a simple attribute or composite attribute is dependent on whether the user view of the model refers to the Address attribute as a SINGLE UNIT or INDIVIDUAL COMPONENTS.

# Single-Valued Attribute

---

- ▶ An attribute that holds a single value for a single entity.
  - ▼ Each MEMBER entity has only a single value for MemberID, Name and Gender.

# Multi-Valued Attribute

---

- ▶ An attribute that holds multiple values for a single entity.
  - ▼ A SALESPERSON entity can have one or more values for Contact Numbers (hand phone, pager, office) and Qualifications.

## Notation

Multi-valued attribute  
is represented by double ovals.

# Single and Multi-Valued Attributes

## Student's Particulars

Name: Joshua Tan

Student ID: S9811111

Date Of Birth: 1 Jan 1981

Hobbies: Cycling, Reading, Swimming

Subjects Registered: Networking, Database,  
Operating Systems

Single-valued  
attributes

Multi-valued  
attributes

# Possible Attribute Types

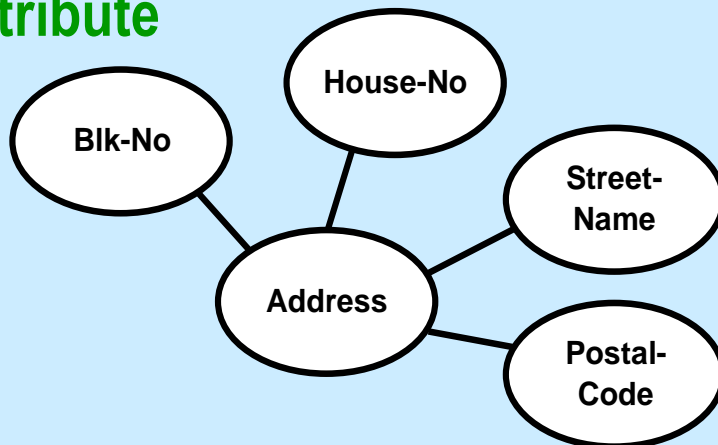

## Simple, Single-Valued Attribute

## Simple, Multi-Valued Attribute

## Composite, Single-Valued Attribute

## Composite, Multi-Valued Attribute

# Derived Attribute

---

- ▶ **An attribute that represents a value that is derivable from the value of a related attribute or set of attributes, not necessarily in the same entity.**
  - ▼ **Age of a person can be derived from his date of birth.**
  - ▼ **Number of employees working for a department can be derived by counting the number of employees that work for that department.**

# Derived Attribute

## Notation

Derived attribute is represented by a dotted oval.

# Key Attribute

- ▶ **Every entity type must have an attribute or a set of attributes that uniquely identifies each entity instance.**
  - ▼ **This key or uniqueness constraint prohibits any two instances from having the same value for the key attribute simultaneously.**
  - ▼ **Some entity types have more than one key attribute.**

# Key Attribute

## ► Examples:

- ▼ Each **STAFF** entity has a unique StaffID.
- ▼ Each **BRANCH** entity has a unique BranchNo.
- ▼ Each **BOOKCOPY** entity is uniquely identified by its ISBN and CopyNo.

# Criteria for Selecting a Primary Key

---

1. Choose a candidate key that will not change its value over the life of each instance of the entity type.
2. Choose a candidate key such that for each instance of the entity type, the attribute is guaranteed to have valid value and not be null.
3. Avoid use of so-called intelligent keys, whose structure indicates classifications, locations, and so on.
4. Consider substituting a single-attribute Surrogate Key for a large composite key.

# Surrogate Key

---

- ▶ **A Surrogate Key is a new attribute that is specifically introduced into an entity to serve as a key to uniquely identify each instance.**
- ▶ **Guidelines for selecting a Surrogate Key:**
  - ▼ **If we cannot select a natural identifier that can guarantee uniqueness of each instance.**
  - ▼ **If the primary key is a large composite key that consists of a number of attributes.**

# Surrogate Key (Cont...)

---

- ▶ **LoanNo of Loan table (Refer to Appendix B: pg B-5 & B-6) is a good example for a surrogate key.**
- ▶ **If not the LoanNo, what could have been the primary key of Loan table?**
- ▶ **Answer:**
  - ▼ (Assuming no member borrows and returns the same book (ISBN) with the same copy number on the same date)
  - ▼ Is this the primary key PK ?==>  
(ISBN, CopyNo, MemberID, DateOut, DateReturn)

# Relationship

# Relationship

---

- ▶ A relationship is an association between the instances of one or more entities that is of interest to the organisation.

A Publisher **publishes**  
many Books.

A Branch **registers**  
many Members.  
Each Member **makes**  
many Loans.

# Relationship

---

# Relationship

- ▶ A relationship is a set of associations between two or more participating entities.

## Notation

A relationship (R) is represented by a diamond-shaped box and is connected to the entities that are related through this relationship.

# Relationship

A Branch registers many Members.  
Each Member makes many Loans.

A Publisher can publish many Books.

# Relationship

# Summary

---

- ▶ **E-R Model is a tool used to derive the Conceptual Data Model.**
- ▶ **E-R Model consists of Entities, Attributes and Relationships.**
